

Please amend the claims as follows:

IN THE CLAIMS:

1. (currently amended) An apparatus for a compression architecture utilizing internal cache residing in main memory, the main memory comprising:

a compression cache to store a plurality of uncompressed data, wherein the compression cache is organized as a sectored cache that has associated tags that are on-die;

a compressed memory to store a plurality of compressed data; and

a compressed memory pointer table (CMPT) to store a plurality of pointers, the apparatus to assign a higher priority to compressed memory read operations in comparison to other operations.

2. (cancelled) The apparatus of claim 1 wherein the compression cache is a sectored cache.

3. (original) The apparatus of claim 1 wherein the compression cache has a plurality of associated tags that are incorporated within a memory interface coupled to the apparatus.

4 . (original) The apparatus of claim 1 wherein the plurality of pointers are to the plurality of compressed data based on a plurality of cache block addresses.

5. (currently amended) The apparatus of claim 3 is coupled to a memory interface that comprises:

a victim buffer to store at least one ~~the~~ entry that has been evicted from the compression

cache;

a CMPT offset calculator to provide an offset relative to the start of the CMPT based on an actual address of the data being compressed.

6. (original) The apparatus of claim 5 wherein the memory interface is incorporated within a processor or a chipset.

7. (original) The apparatus of claim 6 wherein the apparatus is incorporated within a memory controller hub (MCH) of the chipset.

8. (original) The apparatus of claim 5 wherein the entry is evicted based on a first in first out (FIFO) protocol.

9.(currently amended) The apparatus of claim 1 wherein the CMPT stores the plurality of pointers to the plurality of compressed data sequentially based on memory ~~address~~ addresses for the plurality of compressed data. for which the data is compressed.

10. (currently amended) An apparatus for a memory interface comprising:

a first cache to store a plurality of tags for a compression cache;

a victim buffer to store at least one ~~the~~ entry that has been evicted from the compression cache;

an offset calculator to provide an offset relative to the start for a Compressed Memory Pointer Table (CMPT) based on an actual address of a data being compressed; and

a second cache to store a plurality of pointers for the CMPT, the apparatus to assign a higher priority to compressed memory read operations in comparison to other operations.

11. (original) The apparatus of claim 10 wherein the memory interface is incorporated within a processor or a chipset.

12. (original) The apparatus of claim 11 wherein the apparatus is incorporated within a memory controller hub (MCH) of the chipset.

13. (original) The apparatus of claim 10 wherein the entry is evicted based on a first in first out (FIFO) protocol.

14. (currently amended) A method for operating an memory operation comprising:
receiving a memory address for the memory operation;
storing a plurality of compressed data in a main memory; and
performing a tag match between the memory address and a first cache storing a plurality of tags for a compressed memory in the main memory,
assigning a higher priority to compressed memory read operations in comparison to other operations.

15. (currently amended) The method of claim 14 further comprising accessing a plurality uncompressed data access from a ~~the~~ compression cache is performed if the tag match resulted in a hit.

16. (original) The method of claim 14 further comprising locating a pointer and subsequently finding a compressed memory location based at least in part on the pointer if the tag match resulted in a miss for the memory operation for a read miss.

17. (original) The method of claim 14 further comprising compressing the data and storing it in a compressed memory location for the memory operation for a write miss.

18. (currently amended) A system comprising:

a processor; and

a main memory, coupled to the processor, with a

a compression cache to store a plurality of uncompressed data, wherein the compression cache is organized as a sectored cache that has associated tags that are on-die;

a compressed memory to store a plurality of compressed data; and

a compressed memory pointer table (CMPT) to store a plurality of pointers, assign a higher priority to compressed memory read operations in comparison to other operations.

19. (original) The system of claim 18 wherein the compression cache is a sectored cache.

20. (currently amended) The system of claim 18 wherein the compression cache has a plurality of associated tags that are incorporated within a memory interface, ~~coupled to the apparatus.~~

21. (currently amended) The system of claim 18, wherein the plurality of pointers are to the plurality of compressed data based on a plurality of cache block addresses.

22. (currently amended) A system comprising:

a processor; and

a memory interface, coupled to the processor, with a:

a first cache to store a plurality of tags for a compression cache;

a victim buffer to store at least one ~~the~~ entry that has been evicted from the compression cache;

an offset calculator to provide an offset relative to the start for a Compressed Memory Pointer Table (CMPT) based on an actual address of a data being compressed; and

a second cache to store a plurality of pointers for the CMPT.

23. (original) The system of claim 22 wherein the memory interface is incorporated within a processor or a chipset.

24. (cancelled) The system of claim 23 wherein the apparatus is incorporated within a memory controller hub (MCH) of the chipset.

25. (original) The system of claim 22 wherein the entry is evicted based on a first in first out (FIFO) protocol.

26. (currently amended) A system comprising:

a processor, coupled to a memory bridge, the memory bridge to comprise;

a first cache to store a plurality of tags for a compression cache;

a victim buffer to store at least one ~~the~~ entry that has been evicted from the compression cache;

an offset calculator to provide an offset relative to the start for a Compressed Memory Pointer Table (CMPT) based on an actual address is of a the data that is ~~being~~ compressed; and

a second cache to store a plurality of pointers for the CMPT_and

a main memory, coupled to the memory bridge, to comprise

a compression cache to store a plurality of uncompressed data;

a compressed memory to store a plurality of compressed data; and

a compressed memory pointer table (CMPT) to store a plurality of pointers.

27. (original) The system of claim 26 wherein the compression cache is a sectorized cache.

28. (original) The system of claim 26 wherein the compression cache has a plurality of associated tags that are incorporated within a memory interface coupled to the apparatus.

29 . (original) The system of claim 26 wherein the plurality of pointers are to the plurality of compressed data based on a plurality of cache block addresses.
